SE 216 – SOFTWARE PROJECT MANAGEMENT
STAKEHOLDERS DOCUMENT

PROJECT NAME: Vaccine Integrity Monitoring System (VIMS)
GROUP MEMBERS: Muhammet Ali ÖKAN / Ceren ACAY / Azra AKGÜN / Emir Taha GÖKÇE / Ömer Talha ÇEKMEZ / Kayra Alp UŞAKLI / Hakkı Can DURAN / Ege ENGİN

#	STAKEHOLDER	DESCRIPTION
1	Healthcare Centers	These hospitals and clinics receive the vaccines and scan QR codes upon delivery to create the final custody log. If successful, they easily verify vaccine safety and reduce manual checks. If it fails, they risk unknowingly giving ruined vaccines to patients, causing severe harm and legal liability.
2	Vaccine Manufacturers / Suppliers	These pharmaceutical companies define the exact temperature requirements our system must monitor. In success, the system provides time-stamped proof of safe transport, protecting them from unfair blame and financial loss. If it fails, they lose money on spoiled batches and lack the objective data to defend themselves in legal disputes.
3	Patients / End Recipients	Patients are the ultimate beneficiaries who indirectly drive demand for safe vaccine delivery. If the project succeeds, they receive properly stored, effective vaccines that protect them from disease. If it fails, they might receive degraded vaccines, leaving them and their communities vulnerable to health crises and outbreaks.
4	Government Health Agencies	Agencies like the Ministry of Health regulate compliance and can speed up adoption by making VIMS mandatory for national programs. Success allows them to easily verify safety regulations and run reliable vaccination campaigns. Failure leads to public health crises, legal pressure, and international backlash due to undetected vaccine spoilage.
5	Development Team	This is our software engineering team responsible for designing, coding, and maintaining the system. Success delivers a working medical product, building our technical credibility and professional portfolios. Failure means a canceled project, wasted effort, and damaged reputations for failing to meet critical uptime and data accuracy targets.
6	Smart Storage Case Manufacturers	These hardware companies provide the physical cooling cases and sensor APIs the system depends on. A successful integration makes their cases the trusted industry standard, securing long-term contracts. If it fails due to sensor inaccuracy, their hardware is deemed unreliable, leading to lost contracts and a ruined reputation.

7	Insurance Companies	These companies cover financial losses for spoiled shipments and contribute by offering lower premiums for VIMS-monitored deliveries. Success gives them precise data to quickly process claims and prevent fraud. Failure leaves them wasting time and money on long, unpredictable disputes between couriers and manufacturers without objective data.
8	Field Supervisors / Operations Managers	These are the people who actively monitor the dashboard and receive real-time alerts when a cold chain breach is detected. They are the direct users of the AI alerting and live tracking features. If the project succeeds, they can intervene immediately before vaccines are ruined. If it fails, they receive no warnings and only discover spoilage after the damage is done.
9	Vaccination Campaign Field Workers	These are the nurses and health workers who administer vaccines directly to patients, particularly in remote last-mile locations. If the project succeeds, they can confidently administer vaccines knowing the cold chain was maintained throughout delivery. If it fails, they unknowingly inject ineffective or degraded vaccines into patients, exposing themselves to professional liability and causing direct patient harm.
10	Project Sponsors	This is the organization or individual that funds and owns the VIMS system, such as a private health technology company or university research fund. They define the project's scope and budget. If the project succeeds, they own a commercially viable and deployable medical product. If it fails, they lose their financial investment and the time committed to the project.
